

Abstract of the Disclosure

An airbag includes a bag portion to be inflated at a location close to an occupant and a pressure sensor mounted on an inner surface of the bag portion. A harness is connected to
5 the pressure sensor to extend along the inner surface of the bag portion. An airbag device includes the airbag and a gas generator for inflating the airbag. Accordingly, high-speed air flow from the gas generator does not affect the pressure sensor, and it is possible to detect the pressure precisely.
